A company of the Tönsmeier Group
For others, no distance is too long. We rather try to avoid extra miles.

What do all materials have in common? They need to be transported. In order to take care of this in the most economical and environmentally-friendly way, we have opened our new Tönsmeier Special Centre for Transport, with the goal to perfect our logistic activities. We are your one-stop supplier for highest quality standards and cost-effective handling of your transports.

We focus on minimized routes, maximum safety as well as an international network and committed employees. According to the customer’s wishes and requirements we handle only individual logistic services or we organize the entire transport. Whether it concerns short-term or long-term projects – we always have the best solution ready. On a regional basis as well as nation-wide and in many other European countries.

You’ll fare well with this fleet. And so will your truckloads.

Whether you choose a walking-floor or curtainsider truck – our fleet with latest technology and at least Euro 5 standard caters for all needs. Modern communication systems between truck and disposition meet the highest demands, the same goes for our supplier management. Every day, more than 1,000 vehicles are on the road in Europe. Furthermore, the Tönsmeier network offers access to over 2,000 sub-contracted vehicles for all kinds of goods.

Sustainable planning manifests itself in other areas, too. As the demographic change with a growing number of older employees also concerns the logistics sector, we deliberately train younger drivers in order to secure the operational performance of our network in the long run.

And since two heads are better than one, in many cases we use driver teams – for the benefit of an improved vehicle coordination and control.

Green Logistics and Carbon Footprint. These expressions come natural to us.

Besides using low-emission vehicles, there are many more possibilities to manage logistical operations in an environmentally-friendly way. Tönsmeier is making use of all of them. For instance, by training our drivers regularly with regard to economical driving behaviour. Or by applying the latest software in order to calculate the best route combination, thus reducing loaded and unloaded mileage.

However, real Green Logistics takes it one step further. Only a systematic monitoring of CO₂ emissions can ensure certainty about the success. It is one of our main objectives to decrease the Carbon Footprint further and further.

This is happening not only for the benefit of our planet and its nature, but also of you as our customer. In times when a clean eco-balance becomes more and more important, the image gain for a company that makes real efforts in this regard, cannot be overestimated.

On the road together: precisely coordinated transport routes.

It all adds up neatly: Green Logistics from Germany.

Common sense instead of petrol: our drivers have it in their blood.

Tönsmeier Special Centre for Transport – on the move for the environment.
